BEGINNING OF THE YEAR.

By the reformation of the calendar by Gregory, the year began on the first of January, and, consequently, whenever and wherever the new style of reckoning time was adopted, then and there the year commenced on this day.

Previous to the use of the Gregorian calendar, the years had different days of beginning at various times in the same and different countries, and occasionally at the same time in the same country.

In most countries it began on one of the following days :

Christmas-day, the 25th of December ;
Circumcision-day, the 1st of January ;
Lady-day, the 25th of March ;
Easter-day, the day of the Resurrection of our Lord.

In England, in the seventh, and so late as the thirteenth century, the year began on Christmas-day ; but, in the twelfth century, the Anglican Church commenced the year on the 25th of March, as did also the civilians of the fourteenth century. This continued until 1752, the time of adoption of the new style. By this it appears that two modes of reckoning the commencement of the year have generally existed in Great Britain and its colonies, causing what are called the CIVIL, ECCLESIASTICAL, or LEGAL YEAR, and the HISTORICAL YEAR. The last named of these has commenced on the 1st of January for a long period of time.

A VALUABLE TABLE.

A box twenty-four inches by sixteen inches square, and twenty-eight inches deep, will contain a barrel.—A box twenty-six by fifteen and a half inches square, and eight inches deep, will contain a bushel.—A box twelve inches by eleven and a half inches square, and nine inches deep, will contain a half bushel.—A box eight by eight inches square, and eight inches deep, will contain a peck.—A box eight by eight inches square, and four and one-eighth inches deep, will contain one gallon.—A box seven by eight inches square, and four and one-eighth inches deep, will contain a half gallon.—A box four inches by four inches square, and four and one-fourth inches deep, will contain a pint.

DIVISIONS OF TIME.

A SOLAR DAY is measured by the rotation of the earth upon its axis, and is of different lengths, owing to the ellipticity of the earth's orbit and other causes; but a mean solar day, recorded by the time-piece, is twenty-four hours long.

AN ASTRONOMICAL DAY commences at noon, and is counted from the first to the twenty-fourth hour. A CIVIL DAY commences at midnight, and is counted from the first to the twelfth hour, when it is recounted again from the first to the twelfth hour. A NAUTICAL DAY is counted as a Civil Day, but commences, like an Astronomical Day, from noon.

A CALENDAR MONTH varies in length from 28 to 31 days. A MEAN LUNAR MONTH is 29 days, 12 hours, 44 minutes, 2 seconds, and 5.24 thirds.

A YEAR is divided into 365 days.

A SOLAR YEAR, which is the time occupied by the Sun in passing from one Vernal Equinox to another, consists of 365.24214 solar days, or 365 days, 5 hours, 48 minutes, and 49.536 seconds.

A JULIAN YEAR is 365 days. A GREGORIAN YEAR is 365.2425 days. Every fourth year is BISSEXTILE, or LEAP YEAR, and is 366 days. The error of the Gregorian computation amounts only to one day in 3571.4286 years.

TO ASCERTAIN THE LENGTH OF THE DAY AND NIGHT.

At any time of the year add 12 hours to the time of the sun's setting, and from the sum subtract the time of rising for the length of the day. Subtract the time of setting from 12 hours, and to the remainder add the time of rising next morning for the length of the night. These rules are equally true for apparent time.
